

CISC498 Design Document: Web-Based Real-time Data Explorer

Group 8

Presenter:

Yucan Li, Yiming Zheng, Wenran Hou, Zhibing Liu, Huilin Xu

Members:

Yucan Li 18yl259@queensu.ca

Yiming Zheng 19yz38@queensu.ca

Wenran Hou 18wh10@queensu.ca

Zhibing Liu 18zl142@queensu.ca

Huilin Xu 18hx16@queensu.ca

Supervisor: Jianbing Ni

Customer: Laura Thomson, Christopher Omelon, Madeline Myers

External Design

Introduction:

- **Purpose**
 - Facilitate ICELab to organize datasets into a more accessible form
 - Help customer communicate scientific finding effectively and engage people within the community
- **Content Overview**
 - UX design concept
 - User Flow Diagram
 - Usage Scenarios
 - Integration with existing processes
 - Feedback from customer

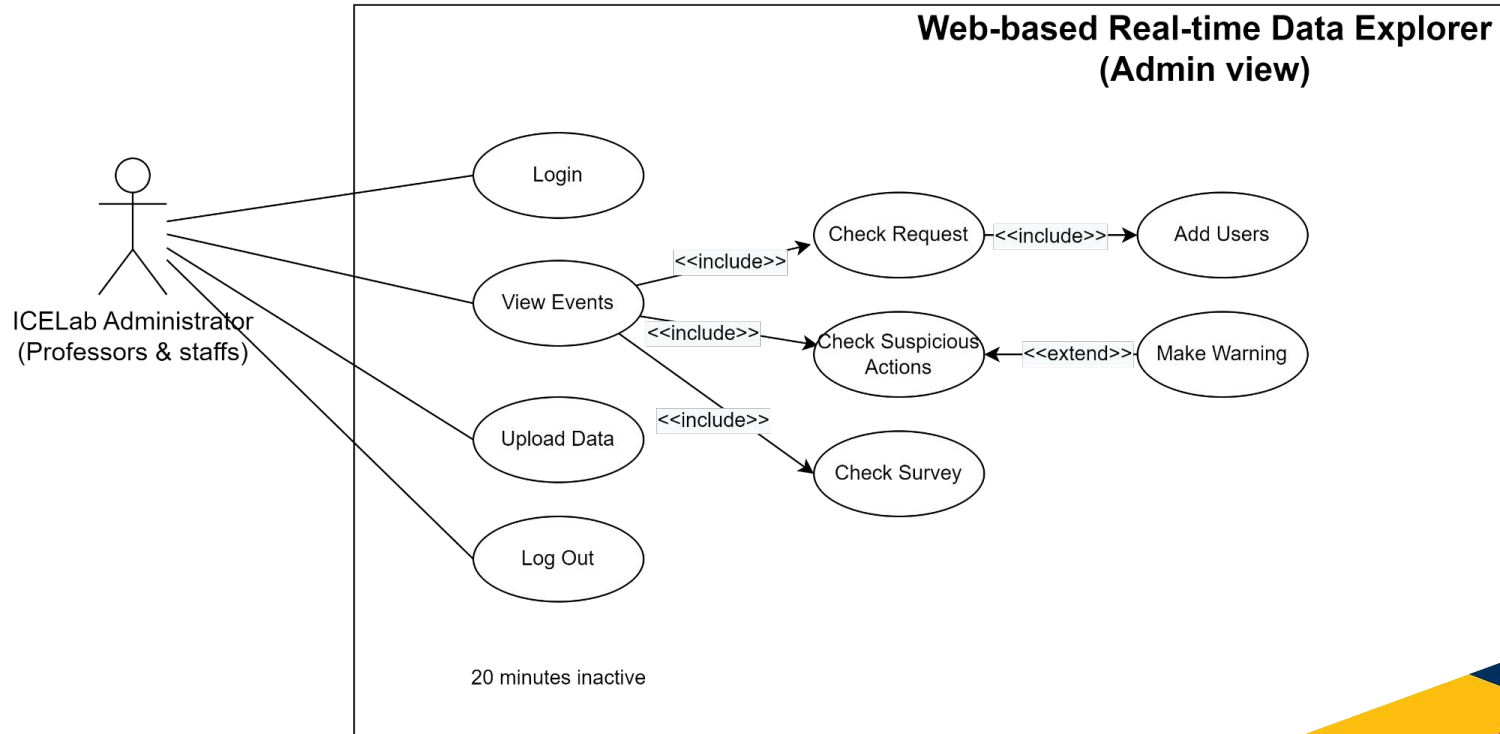

User interface design

Figma Website:

<https://www.figma.com/file/h6OqYGj28BYTM2SncepR3t/CISC498?node-id=0%3A1&t=g19i4AHY3dVAVXC0-0>

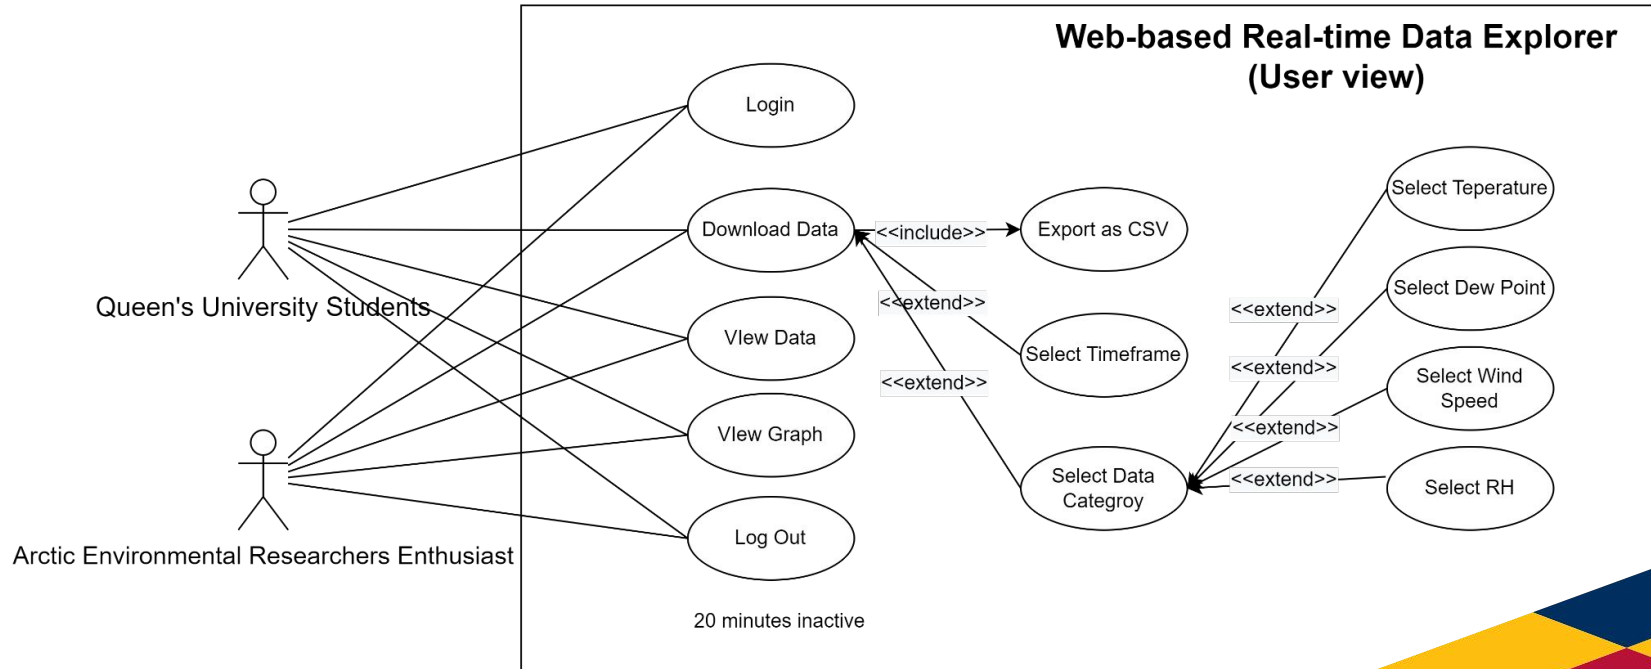

Usage scenarios

- ICELab Administrator (Professors & staffs)

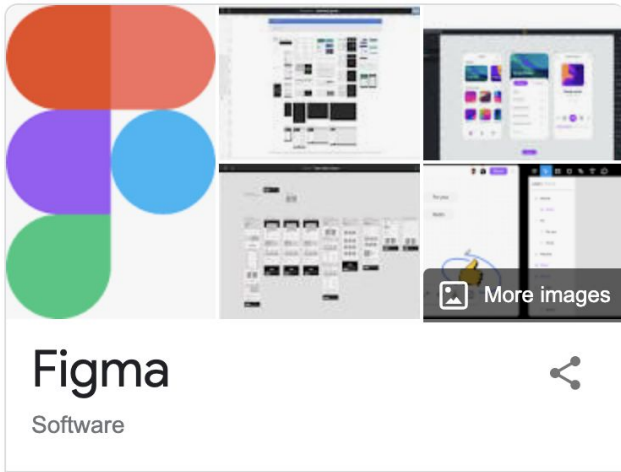

Usage scenarios

- Queen's University Students
- Arctic Environmental Researchers Enthusiast

Prototype

- **Prototype Method**

- **Prototype Design Concept**

1. Optimized operation, Pattern avoidance, Consistency
2. Layout is also consistent in terms of color, formatting, and navigation commands
3. Make each button clearly visible and guided

Work products

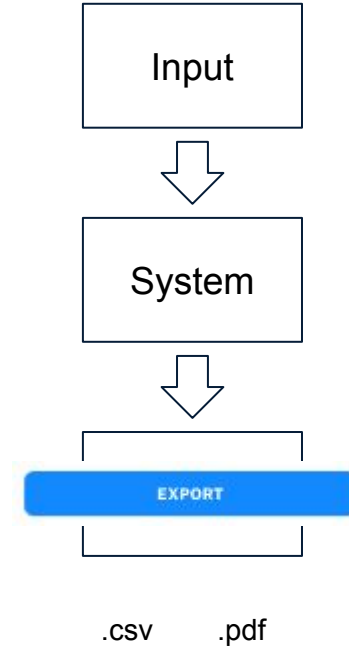

- Require Input
 - Upload datasets (manual or automatic)
 - Update from Dropbox or Queen's Computer
 - Files in .csv format

.csv

Work products

- Require Output
 - Files in .csv and .pdf format
 - Screenshot taken from generated graphs

Integration with existing processes

Our Customer

- Before:

User
Request

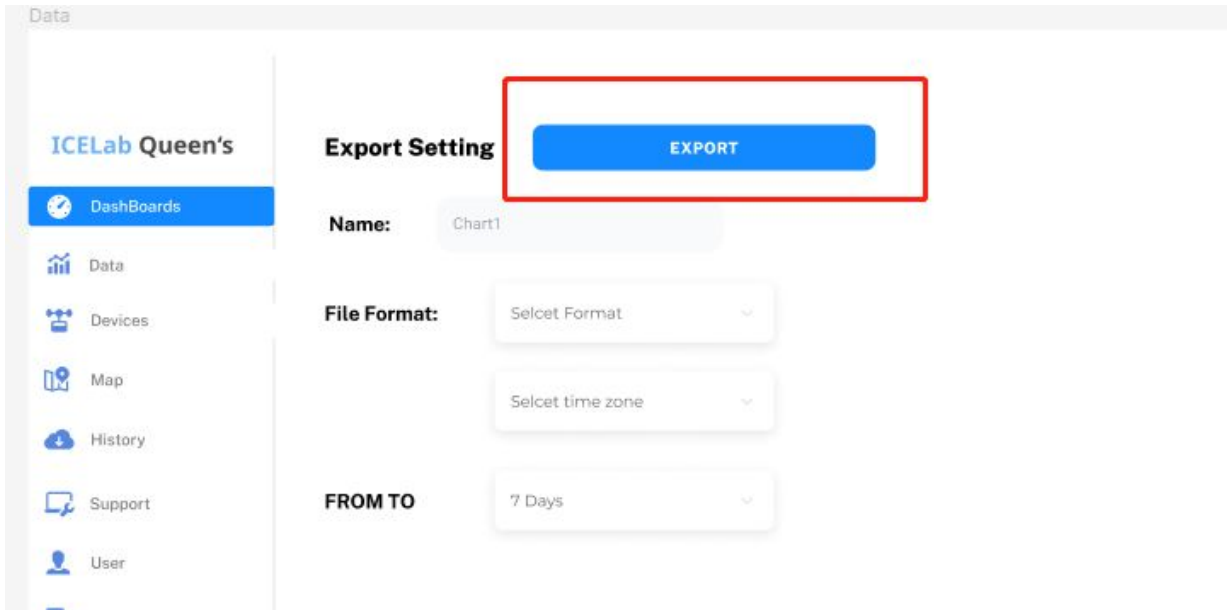

Data

- After:

Feedback from customer

- **Export Setting Page:** customers expect the Export button to be placed at a lower level of the page to match the user's intuition and to make operation easier.

Data

ICELab Queen's

DashBoards

Data

Devices

Map

History

Support

User

Export Setting

EXPORT

Name: Chart1

File Format: Selcet Format

Selcet time zone

FROM TO 7 Days

Feedback from customer

- **Select Data Type:** Users wanted to remove "Gauge" as a data type because it was not a function of the data they were measuring.

Feedback from customer

- Add “Station” category behind each “Device” (a station have several devices)

Feedback from customer

1. Public users should be able to access the Dashboard
2. Making the “Map” first page of the explorer
3. Adding administration page

Internal Design

Programming environment

- **IDE**

Visual studio code && IntelliJ

- **Programming language**

Front-end : javascript, HTML, CSS

Back-end : python

- **Database system**

MongoDB, Mysql

- **Source control system**

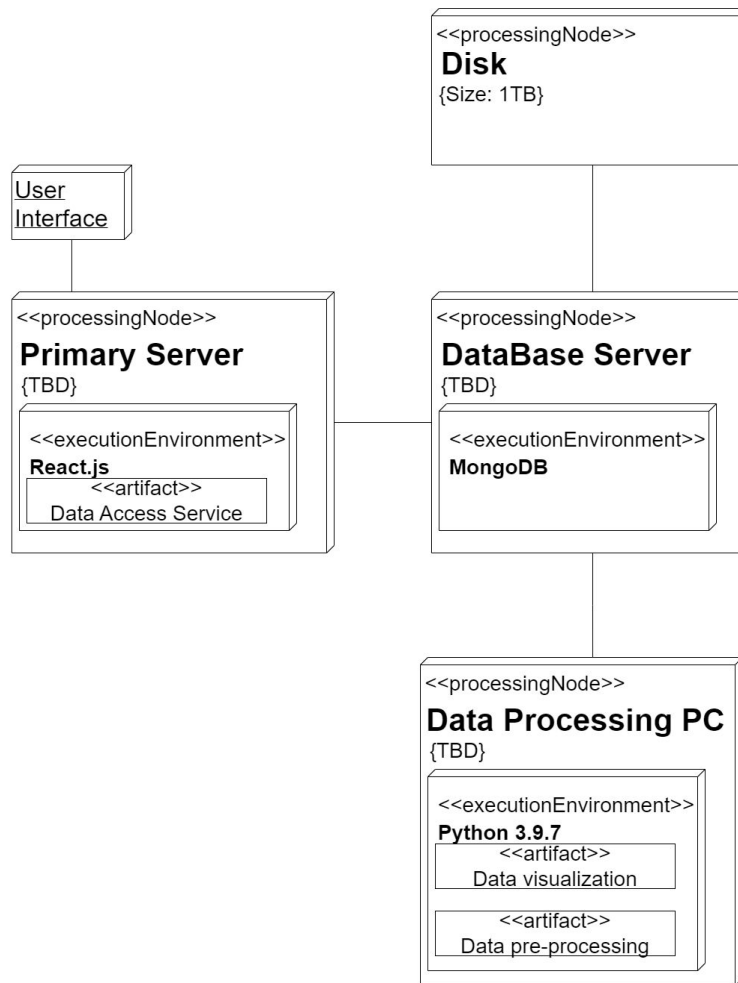

Github, Git

- **UML tool**

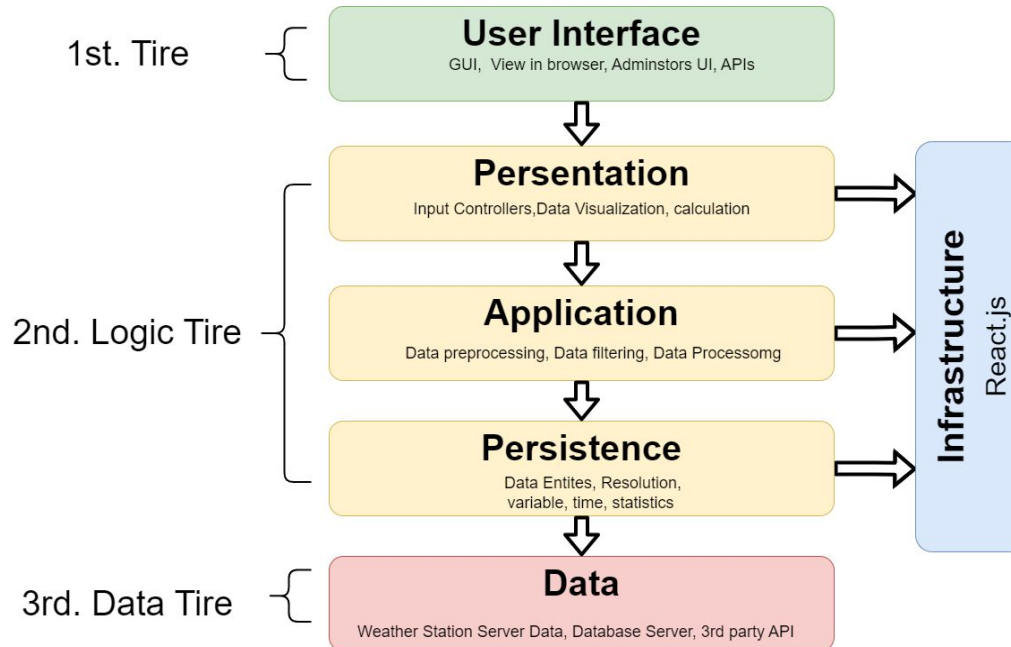

Draw.io

Software architecture

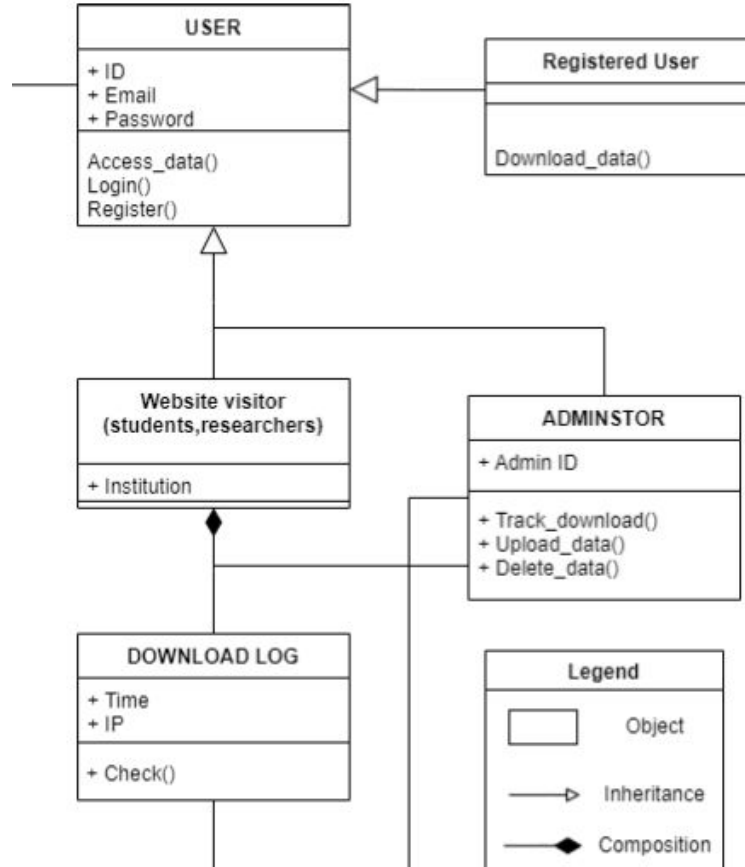

Deployment view

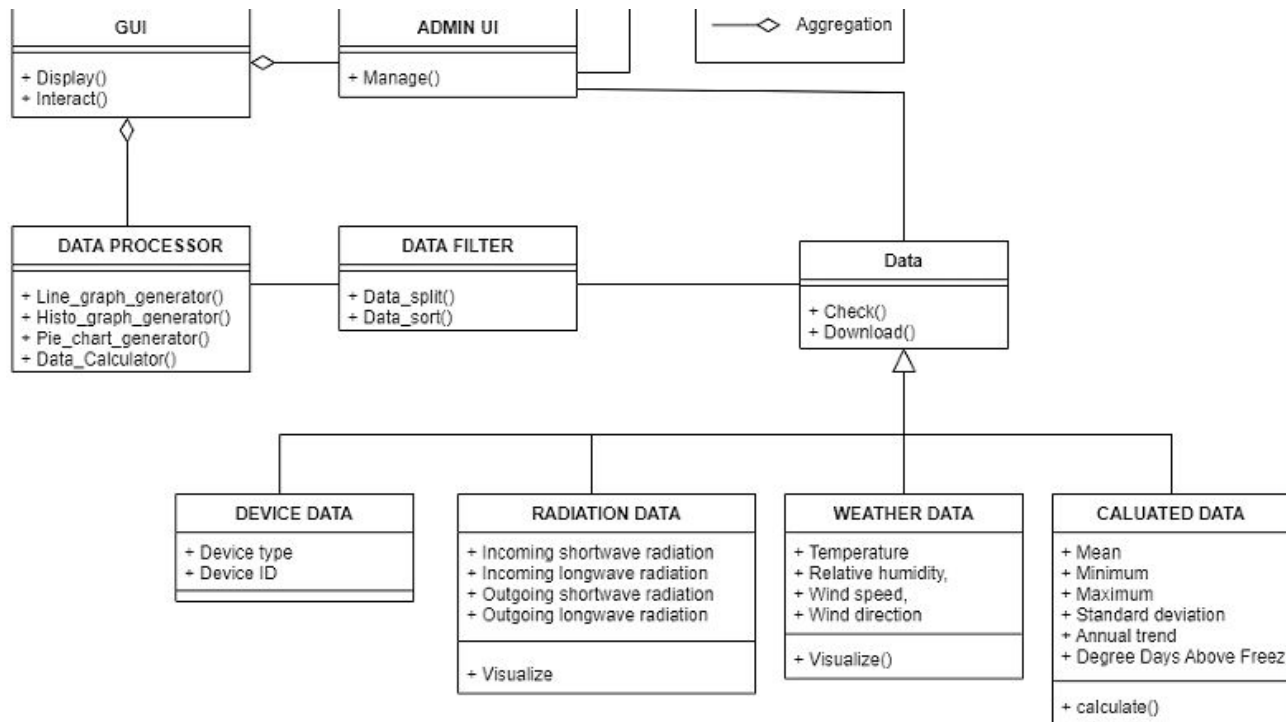

Architecture style

Class diagram

Interfaces of key components

DataBase:

- **Input:**

INT-1: weather data

INT-2: radiation data

INT-3: account data

INT-4: download logs

- **Output:**

OUT-1: data location

- **Pre-condition**

PRE-1: Enough space for input in the disk.

- **Post-condition**

POST-1: Data is stored in the given location.

- **Exception**

Exp-1: Incorrect data type

Exp-2: Manual Interrupt

Exp-3: Store overtime

Data Filter

- **Input:**
INT-1: Data location
INT-2: Time Range
- **Output:**
OUT-1: Splited Data
- **Pre-condition**
PRE-1: Data in the location given is valid
PRE-2: Inputed Time Range is vaild
- **Post-condition**
POST-1: The output Splitted Data fits the input requirements
POST-2: The data in the database remains the same
- **Exception**
EXP-1: Data missing.

Data Visualization

- **Input:**
INT-1: Data
- **Output:**
OUT-1: Different kinds of Graphs
- **Pre-condition**
PRE-1: Input time range is valid
- **Post-condition**
POST-1: Users successfully receive the graph they request.
- **Exception**
EXP-1: Website crashed
EXP-2: Data missing

GUI

- **Input:**
 - INT-1: User interactions
 - INT-2: Administer command
- **Output:**
 - OUT-1: requested data
 - OUT-2: result of commands
- **Pre-condition**
 - PRE-1: Administer's ID has been verified for administer command
 - PRE-2: Website server is running
 - PRE-3: User's Internet connection is stable
- **Post-condition**
 - POST-1: Users successfully receive the service they request.
- **Exception**
 - Exp-1: Server under maintenance

Data design

- Combination of input and output files and databases

<station>::=<location><time><resolution><variables><statistics>

<location>::=region | latitudeLongitude

<time>::=startEnd

<resolution>::=original | <period> | entireDataset

<period>::=monthly | hourly | daily | weekly | annually | seasonally

<variables>::=temperature | relativeHumidity | windSpeedDirection | <radiation> | distance

<radiation>::=<outgoingRadiation> | <incomingRadiation>

<outgoingRadiation>::=outShortwave | outLongwave

<incomingRadiation>::=inShortwave | inLongwave

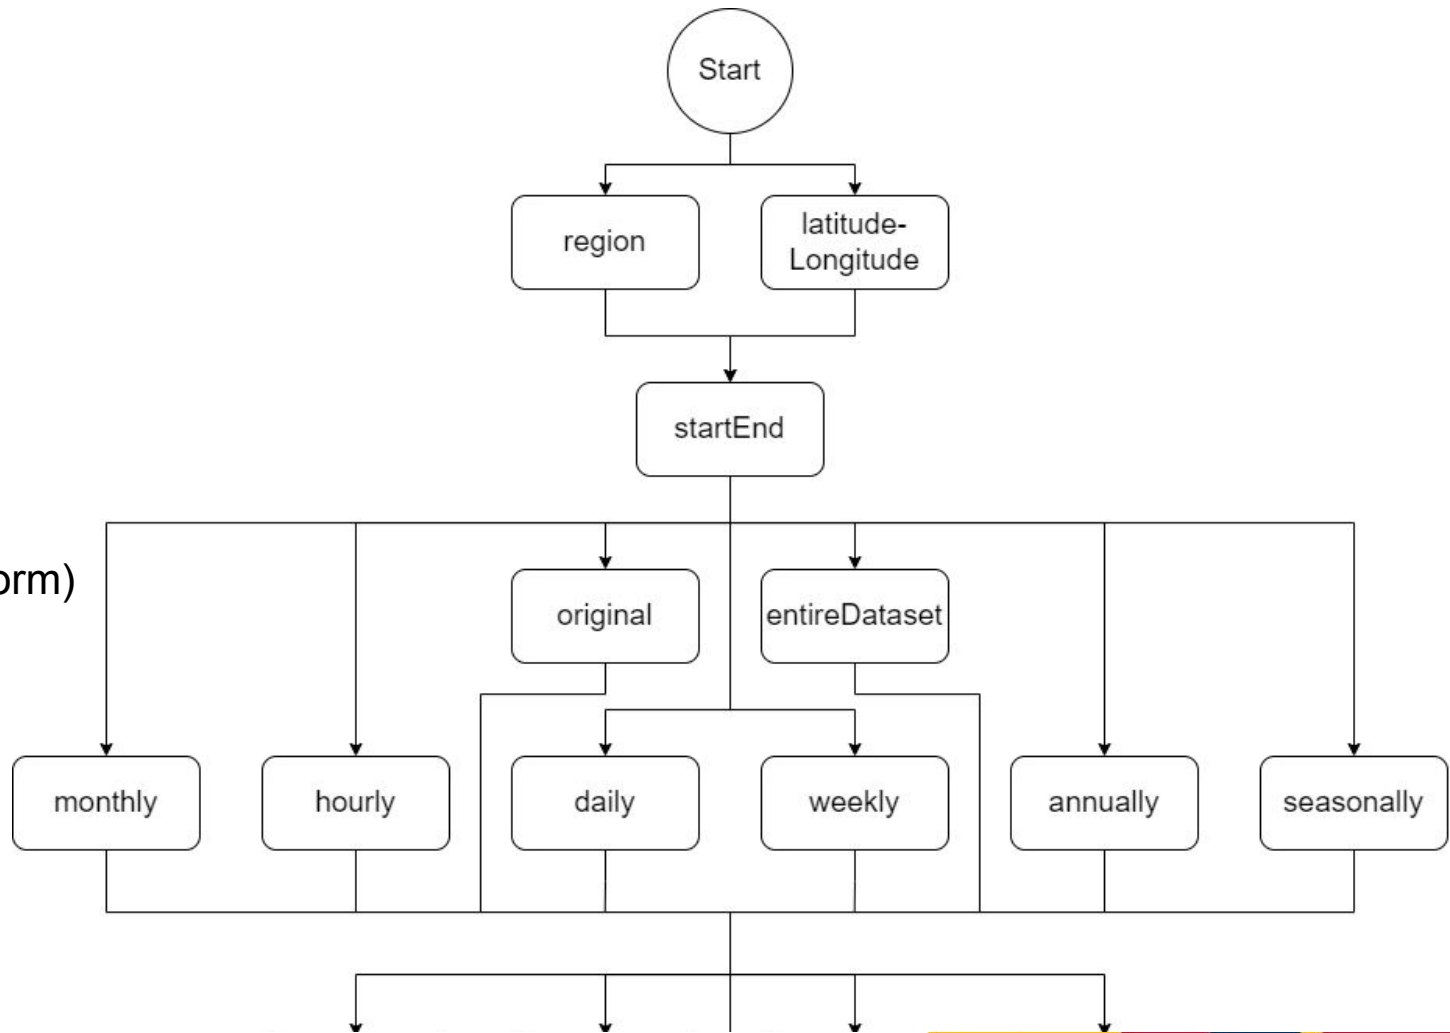

<statistics>::=windFrequency | mean | standardDeviation | <extreme> | annualTrend | degreeDaysAboveFreezing

<extreme>::=minimum | maximum

- Backus–Naur Form

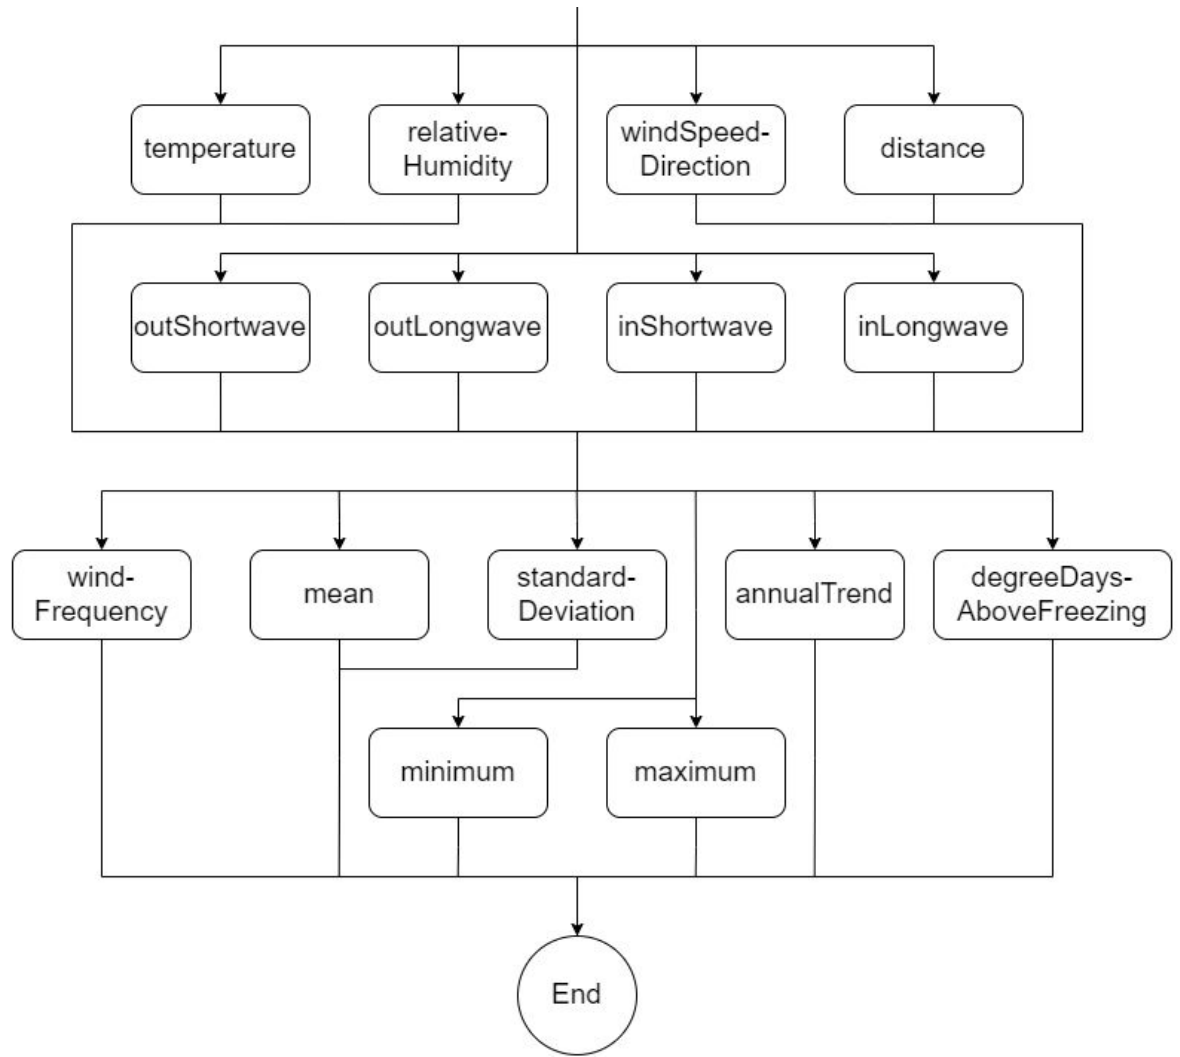

Data design

- Syntax Diagram
(Backus–Naur Form)

Data design

- Syntax Diagram
(Backus–Naur Form)

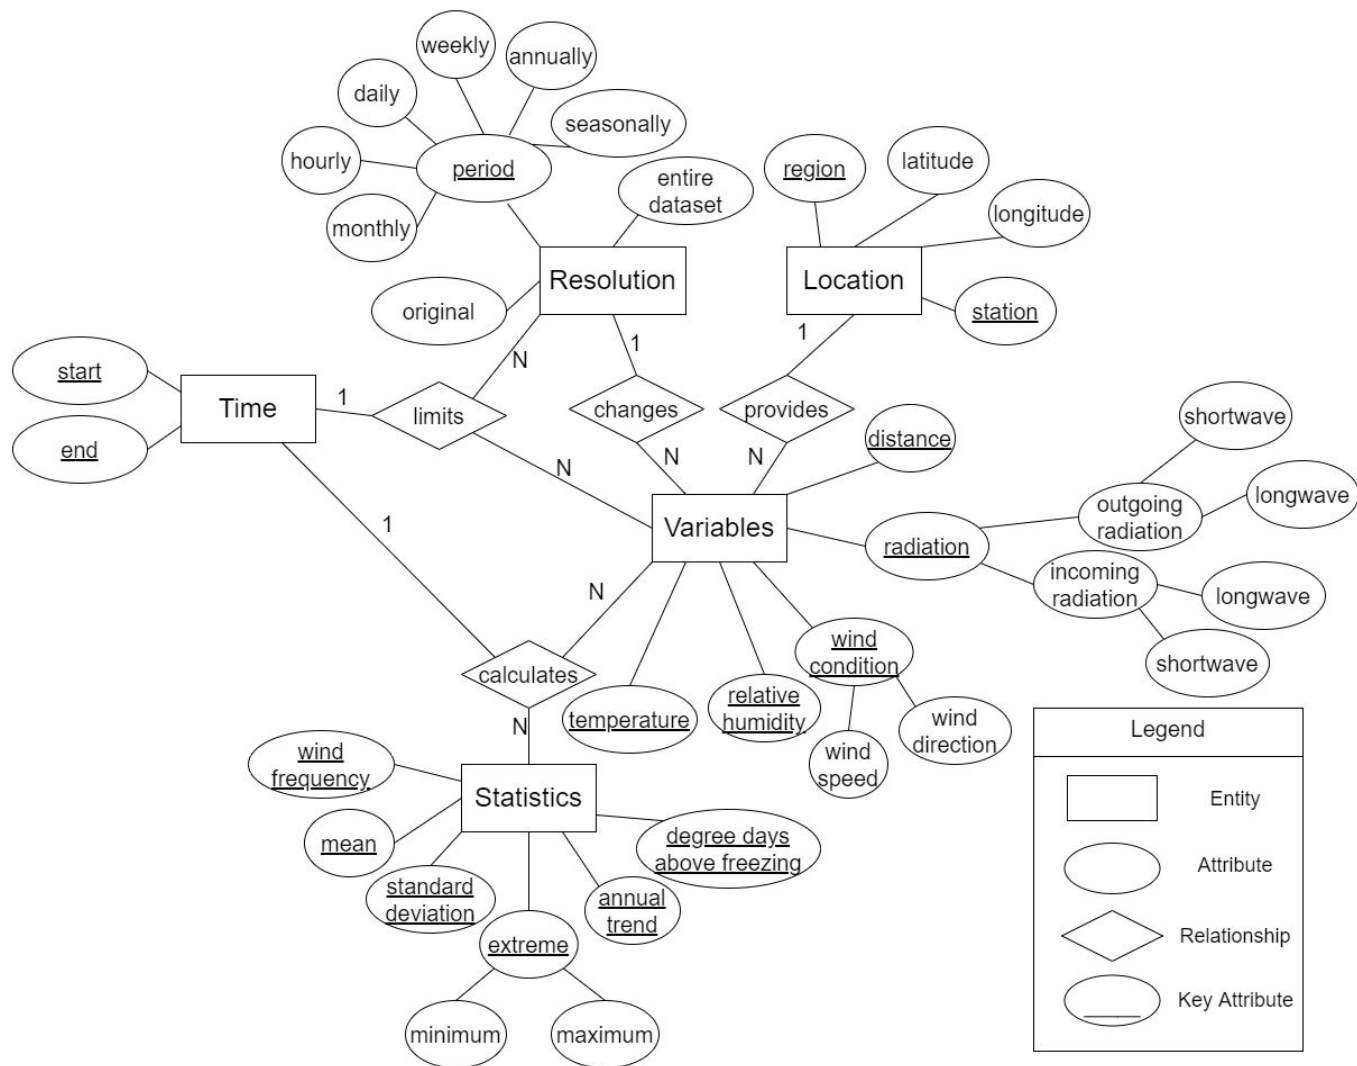

Data design

- Chosen a CSV format instead of an XML format
 1. Plain text file
 2. Less storage space
 3. The data from the station is in CSV format

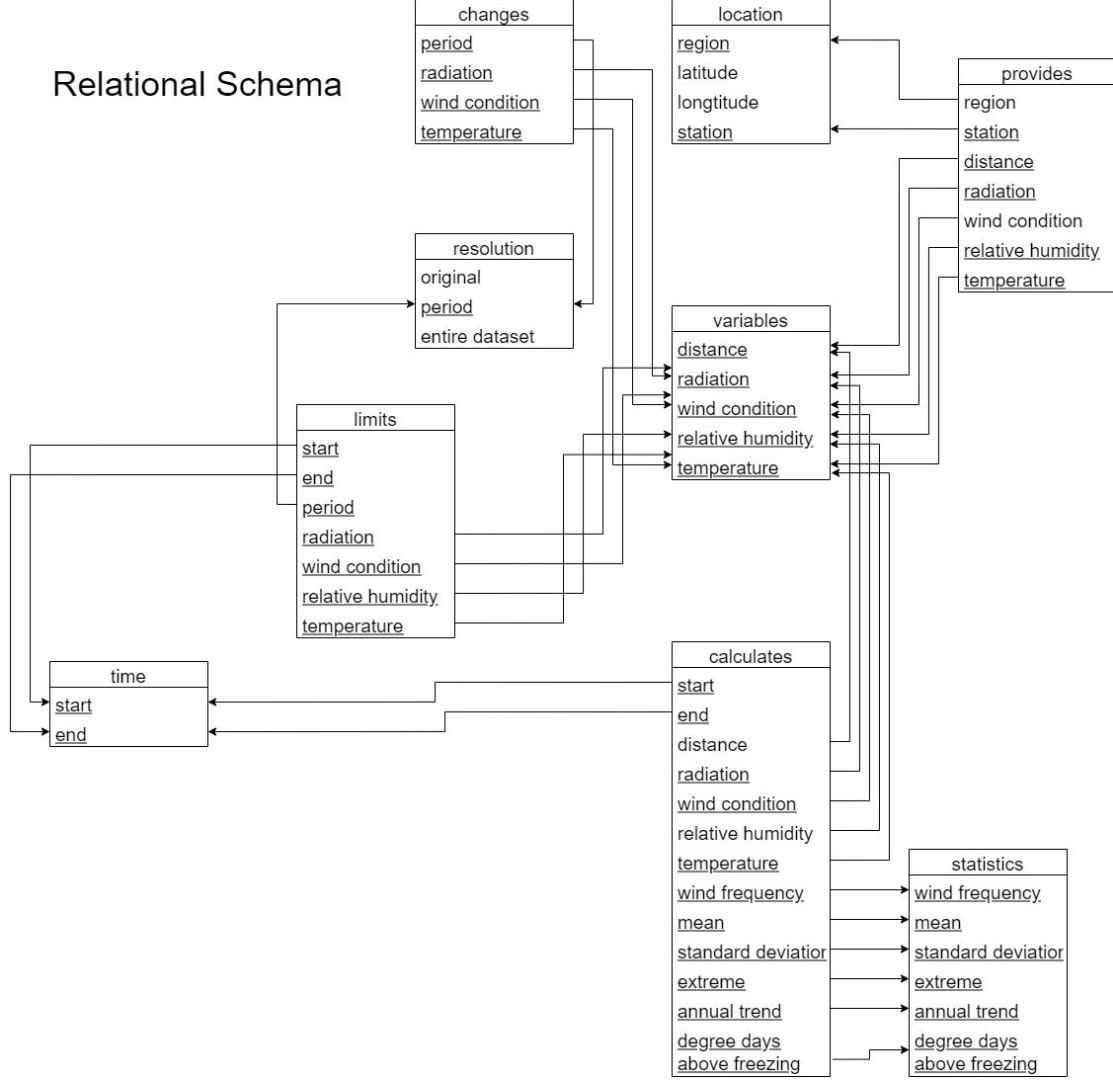

Data design

ER diagram

Data design

Relational Schema

Relational Schema

Algorithms

1. Simple data calculation

2. Plotting of line graphs

Algorithms

3. Plot the polar diagram

Notable tradeoffs

- Functionality vs. Memory Size
 - CSV or XML

Notable Risk

- Performance
- security
 - DDOS
 - Injection

Questions?

Thank you!
